Smoke Alarms... The earliest possible warning of Smoke associated with Fire...

It is proven fact that Smoke Alarms, Save Lives.

Fire Brigades, Building Codes, and even Legislation changes testify to their performance. Some unknown facts still exist though, like how many lives are actually saved by working smoke alarms installed correctly and functioning properly.

Considering the use of multiple detection methods in any home to save vital seconds in the event of a house fire is a must.

Ionisation (fast flaming/small invisible particles) and Photo-Electric alarms (smouldering/slow burning fires) can occur in different parts of the home, and no one detection method is best suited to ALL fire types. Testing and cleaning alarms of dust and bugs regularly for continued performance is recommended as well as having a fresh battery in proper working order.
